EDUCATION

Computer Science for Software Development

York University - BASc

Markham, ON

Expected Apr. 2028

- **Relevant Coursework:** Data Structures & Algorithms, User Interfaces, Software Design, Object-Oriented Programming, Intro to Cloud.

EXPERIENCE

Fullstack Engineer

Dec 2025 – Present

Circe – Internship

- Mentored by a senior engineer on using **Claude Code** and GitHub Copilot as review tools rather than code generators—applied that feedback to catch redundant libraries the AI had introduced and keep the codebase consistent.
- Collaborated with designers and engineers through weekly standups, sprint tickets, and code reviews, incorporating feedback before each merge.
- Built the backend API for user profiles in **FastAPI**, using **JWT** login checks so people can only edit their own data.
- Fixed a bug where the app silently showed outdated information, rewriting how the frontend talks to the backend in **TypeScript** so users always see accurate, current data.
- Built all 5 login and account flows (sign-in, sign-up, confirmation, password reset, forgot password) with real-time error messages, hitting **zero auth-related bugs** before launch.

Technical Lead

Aug 2026

Riipen Labs / PawsKnow – Consulting Project

- Served as technical lead on a 5-person consulting team advising a pre-launch pet care startup, responsible for feasibility and risk assessment across the team's proposals.
- Weighed each proposed strategy against the client's budget, headcount, and systems, cutting the ones a small team could not realistically deliver before launch.
- Delivered a customer experience report with a recommended strategy and a phased rollout plan for the client to execute before a major launch in the near future.

PROJECTS

Legends of Sword and Wand | *Java, Spring Boot, JUnit, Mockito, Maven, Docker, SQLite, GitHub Actions*

- Designed the combat system for a multiplayer **Java** RPG—hero classes, spells, and status effects—using the Strategy and Observer patterns so new classes and abilities plug in without touching the battle engine.
- Wrote the turn-based battle engine resolving turn order, damage, healing, and status effects each round, with guards that end stalled fights instead of looping forever.
- Wrote **96 unit tests** with **JUnit** and Mockito across 5 services and the shared core, covering battle logic, party management, and hero classes so bugs surface before release.
- Built a **3-stage** GitHub Actions pipeline—unit tests, then a full **Docker** spin-up checking every service responds, then image publishing—so nothing ships unverified.

exposr | *React, Node.js, Express, Python, PostgreSQL, Supabase*

- Built a photo-sharing app in **React** where uploaded pictures stay hidden until a set release date each week, like a digital time capsule.
- Verified photos were taken in real time (not uploaded from a camera roll) by reading each image's built-in timestamp and rejecting anything older than 5 minutes.

Interactive 3D Portfolio Experience | *Astro, Svelte, TypeScript, Three.js, TailwindCSS*

- Built my personal portfolio site from reusable **Svelte** components, giving it smooth section transitions and a consistent look across every page.
- Set up automatic deployment with **GitHub Actions**, so every code change pushed goes live without any manual steps.

3D Particle Renderer | *C++17, OpenGL, GLSL, CMake*

- Built a real-time 3D particle simulator from scratch in C++, writing the **OpenGL** graphics pipeline that turns raw physics data into rendered particles on screen.
- Wrote the physics engine—gravity, motion, and collisions—so particles bounce and settle believably without manual tuning.

TECHNICAL SKILLS

Programming Languages: C++, Java, Python, SQL, JavaScript, TypeScript, HTML, CSS

Libraries & Frameworks: React, Node.js, Express, Spring Boot, FastAPI, Flask, Astro, Svelte, TailwindCSS

Databases: PostgreSQL, SQLite, Supabase

Tools & Platforms: Git, GitHub, Docker, Linux, AWS, Maven, JUnit, Mockito, Expo, JIRA, Agile

AI & Automation: Claude, GitHub Copilot, Codex
