Education

Computer Science for Software Development - Cloud Computing Stream — Markham, ON
York University - BASc — *Expected Apr. 2028*

- **Completed:** Data Structures & Algorithms, Software Design, Object-Oriented Programming, Intro to Cloud
- **Learning (2026–27):** Operating Systems, Multicore CPU & GPU Programming, Distributed Computing & Cloud Systems, Databases, Software Testing & Quality, Software Requirements & Analysis

Experience

Founding Software Engineer — Sep 2026 – Present
ForegoneAI

- Building the product **from 0 to 1** as one of the first engineers at a pre-seed AI startup, across the entire stack
- Owned the design and built the screens of an **LLM** product's web app in **Next.js** and **TypeScript**
- Shipping backend features in **FastAPI**, **Pydantic**, and **Supabase PostgreSQL**, tracing AI extractions to their model
- Explained technical decisions in plain terms for our non-technical founder in weekly standups
- Mentored a teammate through the codebase, pushing him to explain the system back in his own words

Fullstack Engineer — Dec 2025 – Jul 2026
Circe – Internship

- Reached launch with **zero auth-related bugs** across all 5 account flows, from sign-up to password reset
- Built the Media Pool feature in a **React Native** app, splitting tile UX into a presentation component and a hook
- Killed a silent stale-data bug by rewriting the **TypeScript** API client between the app and **FastAPI** backend
- Implemented the design team's **Figma** mockups, negotiating icon and layout compromises with existing components
- Caught redundant AI-added imports before merge, mentored by senior engineers to treat **Claude Code** as a reviewer

Technical Lead — Aug 2026
Riipen Labs / PawsKnow – Consulting Project

- Led feasibility and risk review on a **5-person** consulting team advising a pre-launch pet care startup
- Delivered a **14-slide** customer experience report with a recommended strategy and a phased rollout plan

Projects

Issei's Comms | *React, Vite, TypeScript, Express, Supabase, Chrome DevTools Protocol*

- A commission platform for a digital artist, built in **React**, **Vite** and **TypeScript** with a retro boot-screen UI
- Cut sustained **GPU** load with no visible change, swapping a max-width animation for **clip-path** (44 layout passes to 0)
- Measured per-process CPU before and after each change through the headless **Chrome DevTools Protocol**
- Kept every visual effect on after measuring showed the remaining ones cost less than run-to-run noise

Interactive 3D Portfolio | *Astro, Svelte, TypeScript, Three.js, TailwindCSS*

- Built a personal site, a 3D space you scroll through instead of clicking between pages, in **Astro** and **Svelte**
- Assembled it from **8** reusable Svelte components with scroll-driven transitions, auto-deployed on every push

Legends of Sword and Wand | *Java, Spring Boot, JUnit, Maven, Docker, GitHub Actions*

- Wrote **45 JUnit tests** over the battle engine, hero classes and services in my own build of a multiplayer **Java** RPG
- Made new hero classes pluggable with Strategy and Observer patterns, capping turns to stop fights looping forever
- Built the 3-stage **GitHub Actions** pipeline for a 6-service team project: tests, a **Docker** smoke test, image publish

Technical Skills

Programming Languages: TypeScript, JavaScript, Python, Java, C++, SQL, HTML, CSS
Libraries & Frameworks: React, React Native, Next.js, Svelte, Astro, Three.js, Vite, Node.js, Express, FastAPI
Databases: PostgreSQL, SQLite, Supabase
Tools & Platforms: Git, GitHub Actions, CI/CD, Chrome DevTools, Docker, AWS, Figma, Expo, JUnit
AI & Automation: Claude, GitHub Copilot, Codex
